

What the redesign does to enhance CRO

ASAP Components · mapped to the CRO baseline

Scope

An inventory of the conversion-enhancing decisions built into the redesign, each tied to the specific problem it addresses in CRO-BASELINE.md. Every group opens with the baseline lever it pushes (shown in blue) so this reads as 'why', not just 'what'.

The baseline problems these enhancements target

- **Top-of-funnel leak:** only ~0.6% of visitors search or start a form - the single biggest opportunity.
- **Weak SEO catalog pages:** the /nsn/* pages pull organic traffic but convert at just 1-2%.
- **~50% search-miss rate:** roughly half of part-number searches return no match - every miss is a lost RFQ.
- **Protect the winners:** the RFQ page (62%) and homepage (12.6%) are where conversion actually happens.
- **Quality over blended:** real buyers arrive via Organic Search / AI Assistant (4-15%); measure there. Desktop is 99% of usage.

The ten levers

- 1 Cut friction so more of the top-of-funnel engages
- 2 Multiply conversion entry points & remove dead ends
- 3 De-risk the ask with reassurance at the decision point
- 4 Domain-specific urgency & prioritization levers
- 5 Lead quality & qualification
- 6 Search built to reduce the cost of misses
- 7 Cart & BOM - new bulk-quote conversion surfaces
- 8 Content & AI-channel optimization
- 9 Desktop-first execution
- 10 Instrumented so CRO is measurable & improvable

1

Cut friction so more of the top-of-funnel engages

Baseline lever: the #1 leak - only ~0.6% of visitors search or start a form.

- **3-field hero quote bar above the fold** (part #, qty, work email) - the shortest path from landed to lead, on the highest-traffic page.
- **Persistent 'Instant RFQ' CTA in the header of every page** + a footer CTA - a conversion path on every SEO long-tail landing page, one click away.
- **Rotating example part numbers** in the hero field teach visitors what to type, removing 'what do I do here' hesitation.
- **Progressive disclosure** - attaching a BOM collapses the whole part-details section; the AOG toggle auto-fills the urgency field. Fewer visible fields protects the healthy ~48% form-start-to-submit rate.

2

Multiply conversion entry points & remove dead ends

Baseline lever: lift the 1-2% /nsn/ SEO pages and recover the ~50% search-miss loss.*

- **Per-row dual CTAs on every catalog listing** - each part offers both 'RFQ' and 'Add to cart'. This is exactly the RFQ hook the baseline says the SEO catalog pages are missing.
- **The no-dead-end rule** - any search with no catalog match routes to a pre-filled quote request instead of an empty results page, converting misses into RFQ opportunities.
- **Every browse surface carries an RFQ link** - manufacturer chips, CAGE tables, and part-detail pages all lead to a quote.
- **Pre-fill handoff via query params** - mini-forms pass part/qty/email straight into the full form, so users never retype (a classic abandonment point).

3

De-risk the ask with reassurance at the decision point

Baseline lever: protect the high-intent pages; raise completion on quality traffic.

- **The '15 minutes, 24/7 x 365' promise repeated at every submit point**, not just the homepage.
- **Microcopy right at the button** - 'Quotes back within 15 minutes' + 'We never share your information' - kills the two biggest B2B hesitations (speed + data privacy) where the decision happens.
- **Server-issued reference number** on success (e.g. ASAP-K4F2A9) - tangible proof the request landed, reducing 'did it go through?' drop-off and duplicate submits.
- **Trust density next to conversion** - certifications, '5,100+ manufacturers', and named OEM logos placed adjacent to the ask.

4

Domain-specific urgency & prioritization levers

Baseline lever: raise intent-to-submit on the buyers who convert.

- **AOG (Aircraft-on-Ground) checkbox** - speaks the buyer's language, adds urgency for the highest-intent leads, and auto-sets 'Need parts by = Immediately'.
- **'Need Parts By' quick options** (Immediately / 1-2 weeks / 1 month / Flexible) - captures urgency signal that helps sales prioritize and convert faster.

5

Lead quality & qualification

Baseline lever: convert better leads, not just more - and route them faster.

- **Company Type dropdown** (Manufacturer / Distributor / Airline / Broker) qualifies the lead inline, no added friction.

- **Comments placeholder that coaches** the buyer to include target price / alternates / condition - richer leads quote faster.

6 Search built to reduce the cost of misses

Baseline lever: cut the ~50% search-miss rate (and measure it via results_count).

- **Cmd-K command palette + scoped header search** (Part # / NSN / CAGE / Manufacturer) - matches how procurement actually searches.
- **Ranked autocomplete with match highlighting** and a rich zero-state (curated browse + quick links) - helps users find a match before they miss.
- **The 'search' event carries results_count** - so the miss rate the baseline targets is directly measurable, and every miss still routes to a quote.

7 Cart & BOM - new bulk-quote conversion surfaces

Baseline lever: pure upside - paths the legacy single-form site never had.

- **'RFQ cart'** lets buyers bundle many parts into one quote request - a conversion the old single-form site couldn't capture.
- **'Add line item by part number'** builds an RFQ with zero searching.
- **BOM / parts-list upload** with client-side parse + editable review + sample CSV + email fallback - captures bulk buyers a single field never could.
- **Reported separately by method** (generate_lead method=cart|bom) so this shows as upside without distorting the like-for-like RFQ comparison.

8 Content & AI-channel optimization

Baseline lever: nurture the best-converting channel - AI Assistant at ~15%.

- **Clean, structured, fast, statically-generated pages** with per-page metadata and semantic markup - favored by the Organic Search + AI-Assistant traffic that actually converts.
- **Content pages end in conversion CTAs** - Blog, Quality, and About all close with a dual RFQ / contact CTA, so content traffic has a path to lead.

9 Desktop-first execution

Baseline lever: match the 99.4%-desktop reality; don't over-invest in mobile.

- **The command palette, mega-menu, sticky sidebars, and wide data tables** are optimized for the desktop procurement user - effort spent where the volume and intent are (while still fully responsive).

10 Instrumented so CRO is measurable & improvable

Baseline lever: enables every comparison in CRO-BASELINE.md / CRO-COMPARISON-PLAN.md.

- **A typed GA4 funnel** - search > view_item > add_to_cart / rfq_start > rfq_form_start > generate_lead - with generate_lead as the single north-star and micro-conversions making every drop-off diagnosable.
- **generate_lead breaks down by method** (rfq / cart / bom) and rfq_start by source - enabling the like-for-like comparison the launch plan requires.
- **Consent-first analytics** (Consent Mode v2 denied by default) + a persistent cookie choice - clean, compliant data.
- **search carries results_count** so the miss-rate reduction target is trackable.

CRO-integrity caveats (fix before crediting these paths)

- **BOM edited line items and the T&C; acknowledgment do not currently reach the server** - fix before leaning on BOM as a credited conversion path.
- **Three RFQ mini-form components are built but unwired** - none block conversion, but clean them up.
- **Compare like-for-like at launch** - break generate_lead down by source vs legacy Normal_RFQ so the redesign isn't credited just for counting more entry points (per the comparison plan).

Lever -> expected KPI impact

Enhancement group	Baseline metric it should move	Direction
Friction cuts + entry points (1, 2)	Top-of-funnel engagement (~0.6% search/form-start)	Up
RFQ hooks on catalog rows (2)	/nsn/* SEO page conversion (1-2%)	Up
No-dead-end search (2, 6)	Search-miss rate (~50%)	Down
Reassurance + reference (3)	Form-start -> submit completion (~48%)	Up / hold
Urgency + qualification (4, 5)	RFQ conversion on Organic Search (4.23%)	Up
Cart + BOM (7)	Total RFQ volume (upside, by method)	Up
Content + AI optimization (8)	AI-Assistant / Organic conversion (15% / 4.2%)	Up / hold
Instrumentation (10)	Makes all of the above measurable	Enables
