

ASAP Components

Lead conversion · Search experience · Overall UX

A walkthrough of the site — homepage, the Cmd-K search & typeahead, the search-to-RFQ flow, catalog listings, the RFQ cart, and the underlying analytics/lead-capture code — with the conversion and UX patterns worth keeping.

1

Lead conversion

Multiple low-friction entry points, all funneling to one action (RFQ).

Low-friction entry points

- **Hero quick-quote form** above the fold with just 3 fields (Part #, Qty, Work Email) — the shortest possible path to a lead. Rotating placeholder part numbers (MS27039..., NAS13..., 5306-01-...) teach the user what to type.
- **Persistent “Instant RFQ” button** in the header on every page, plus a footer CTA (“Need a part fast? Get a quote in 15 minutes”). The primary conversion is never more than one click away.
- **Per-row dual CTAs** in catalog tables: every part offers both an “RFQ” and an “Add” (to cart) button, capturing both “I want this one now” and “I’m building a list” intents.

Value proposition doubles as conversion reassurance

- **“RFQs in 15 minutes, 24/7/365”** repeats at the hero, on listing pages, on the cart, and beside the submit button — anchoring urgency at the decision point.
- **Microcopy under the submit button:** “Quotes back within 15 minutes · We never share your information” — kills the two biggest B2B hesitations (speed + data privacy) exactly where they matter.

Domain-specific conversion levers

- **AOG (Aircraft on Ground) priority checkbox** — “We’ll prioritize it and expedite your quote.” Speaks the buyer’s language and adds urgency for the highest-intent leads.
- **Lead qualification built into the form:** “Company Type” (Manufacturer / Distributor / Airline / Broker) and “Need Parts By” (Immediately / 1–2 weeks / 1 month / Flexible) qualify and prioritize leads without adding friction.
- **BOM / parts-list upload** (“quote the whole list”) with a downloadable sample CSV — removes the biggest barrier for bulk buyers.

Search-as-lead-gen & trust

- **Search is the top of the funnel:** any part search lands on a pre-filled RFQ page (“Searched part number X — get a quote online”), so search is never a dead end.
- **Server-issued reference numbers** (e.g. ASAP-K4F2A9) give a stable, trustworthy confirmation token and set up CRM handoff.
- **Trust density near every ask:** AS9120B / ISO 9001 / FAA / ITAR / NIST 800-171 badges, “5,100+ manufacturers,” “5M+ parts,” and named OEM logos (Boeing, Lockheed, Honeywell) sit adjacent to the conversion.

2

Search experience

- **Command palette (Cmd-K)** — a power-user pattern rare in this industry. Keyboard-navigable (arrow keys to move, Enter to select, Esc to close — hints shown inline) with a useful zero-state (Browse Catalog + Quick Links) so an empty query still guides the user.
- **Live typeahead** with matched-prefix highlighting; each result shows part number + description + manufacturer — enough context to pick confidently.
- **Scoped search** dropdown (Part Number / NSN / CAGE Code / Manufacturer) — matches how procurement people actually search.
- **Filter-within-results** on listing pages plus manufacturer filter chips (“Top Searched NSN Manufacturers”), with clear pagination (“75 parts · page 1 of 5”).
- **Graceful fallback:** an unrecognized part number still routes to a quote page rather than a “no results” wall — no search ever ends in failure.

3

Overall UX

- **Clear information architecture** — breadcrumbs, a category mega-nav, and a consistent sidebar (Browse Categories / Why Choose Us / certifications) that keeps orientation and secondary CTAs present.
- **“RFQ Cart” reframing** — the cart is a bulk-quote builder (“submit one request for a competitive quote on everything”), not a checkout. Its empty state teaches two next steps (browse catalog / add a line item).
- **Strong, restrained visual system** — navy/white, generous type scale, consistent card and table patterns; credible and defense-industry appropriate.
- **Privacy-respecting cookie banner** with an explicit “Decline non-essential” option (not a dark pattern).
- **Persistent chat widget** for a human fallback.
- **Instrumented for optimization** — a typed GA4 funnel tracks the whole journey: search > view_item > add_to_cart / rfq_start > rfq_form_start > generate_lead, plus micro-conversions (tel_click, mailto_click, chat_open, bom_upload). generate_lead is defined as the single north-star conversion, so drop-off is diagnosable at every step.
- **Responsive** — nav collapses to a hamburger and the quick-quote form stacks full-width on mobile.

A couple of nits worth flagging

- On mobile (375px) the **hero H1 clips horizontally** — “Proudly Supporti...” / “The USA and her A...” get cut off. Worth a smaller mobile type size or a wrap.
- The RFQ page’s right column **repeats the full certification list twice** (also duplicated in the homepage marquee) — intentional for the scrolling marquee, but reads oddly as static text on the RFQ sidebar.
