

CRO Baseline Scorecard — Live Site

Property: ASAP Components – GA4 (`G-GW4LSQMS55`) · **Site:** asap-components.com

Window: 2026-05-12 → 2026-08-09 (last 90 days) · **Pulled:** 2026-08-10

The one-line story: The legacy site pulls huge traffic (~176K sessions/90 days) but **~97% is bot / low-quality** Direct + Unassigned traffic (~1-second visits). Real buyers arrive via **Organic Search, AI Assistant, and Referral** and convert well. The blended conversion rate (0.05% RFQ) is misleading — **the redesign should be measured on quality traffic, where the real baseline to beat is ~4.2% on Organic Search.**

0 · Conversion definition

Primary conversion (North Star): `Normal_RFQ` — the legacy site's intentional "RFQ submitted" event. Apples-to-apples match for the redesign's `generate_lead`.

Secondary (context only): `form_submit` — GA4-automatic; fires on *all* forms (search, filters, exit popup), overcounting leads ~11x. Track the trend, not as the lead number.

Comparison-integrity note: the redesign's `generate_lead` fires on every RFQ path (hero, inline, quick-quote, BOM, cart); legacy `Normal_RFQ` may cover fewer paths. At launch, break `generate_lead` down by source and compare like-for-like so the redesign isn't credited merely for *counting* more entry points.

1 · Headline metrics

Metric	Value
Sessions	176,347
Total users	177,724
Primary conversions — <code>Normal_RFQ</code>	67 events · 34 users
Conversion rate (primary)	~0.05% by session · ~0.025% by user
Secondary — <code>form_submit</code> (all forms)	1,527 events · 366 users → ~1.12% by session (noisy)
Engagement rate	4.23% blended — but ~55% on quality channels
Avg. engagement time / session	~2s blended (bot-dragged) · 35–55s on Organic/AI/Referral

2 · Funnel & biggest drop-off

By users (each event's "Total users"), 90-day window.

Step	Users	% of visitors	Notes
Entered site	135,723	100%	
Used search (<code>view_search_results</code>)	795	0.59%	massive drop — almost nobody engages
Started a form (<code>form_start</code>)	759	0.56%	
Submitted a form (any)	366	0.27%	~48% of form-starters finish
Requested a quote (<code>Normal_RFQ</code>)	34	0.025%	the true lead

Biggest leak: entered site → engaged. Only ~0.6% of visitors search or touch a form; a huge, SEO-heavy top-of-funnel that mostly bounces. Getting even a slightly larger fraction to engage is the redesign's biggest opportunity. Form-start → submit at ~48% is already healthy — **the form itself isn't the problem.**

Search demand signal: legacy tracks search hits vs misses (`Partnumber/NSN/CAGE/MFG/Part_Type_Search_Exist` vs `_Non_Exist`). Roughly **half of part-number searches return no match** — every miss is a lost RFQ.

3 • Device split

Device	Users	Share
Desktop	~177,000	99.4%
Mobile	980	0.6%
Tablet	17	0.0%

Optimize DESKTOP, not mobile. This audience is ~99% desktop (B2B aerospace/defense procurement + likely some bot traffic) — the inverse of a normal site. The redesign's CRO effort should target desktop; mobile has negligible volume. OS is almost entirely Windows; browser mostly Chrome.

Traffic-quality flag: 99.4% desktop + Windows-only + only ~0.6% engaging + 34 RFQs / 135K users indicates a meaningful share of bot / low-intent traffic inflating the denominator. True human conversion is likely higher than 0.05%. Doesn't break the before/after (same definition both sides), but consider a bot/quality segment before over-interpreting absolute rates.

4 • Acquisition channels — the key finding

Channel	Sessions	Engagement	Avg time	Key-event rate
Direct	128,754 (73%)	3.47%	1s	0.16%
Unassigned	41,946 (24%)	0.11%	2s	0.03%
Organic Search	4,819 (2.7%)	55.3%	35s	4.23%
AI Assistant	254 (0.1%)	59.5%	55s	14.96%
Referral	231 (0.1%)	56.3%	43s	10.39%
Organic Social	3	100%	27s	0%

THE key finding: ~97% of traffic (Direct + Unassigned) is bot / low-quality — near-zero engagement, ~1s visits, ~0.1% conversion. It drags the blended rate to 0.05%. **The real humans come via Organic Search / AI Assistant / Referral and convert at 4–15%.**

Measurement decision: judge the redesign primarily on **Organic Search conversion (~4.2% baseline)**, not the blended rate — a swing in bot volume must not mask the redesign's true effect. Segment reports to Organic Search (± Referral/AI) when comparing before/after.

Channel to nurture: AI Assistant (ChatGPT / Perplexity referrals) converts best (~15%). Favor clean content + structured data on the redesign.

5 • Top landing pages

Landing page	Sessions	Key-event rate
(not set)	42,584 (24%)	<0.01% bot/junk
/ (homepage)	556	12.59%
/nsn/nsn-parts	140	2.14%
/straightrfq	107	61.68%
/nsn/niin-parts	69	1.45%
/nsn/cage-codes	60	1.67%
/rfq/thankyou	52	32.69% post-conversion
/partno-search	22	13.64%

129,205 landing pages total — a huge SEO long tail.

Model pages to protect in the redesign: `/straightrfq` (62%) and the homepage (12.6%) are where conversion actually happens. The `/nsn/*` SEO catalog pages pull traffic but convert at 1–2% — a big opportunity to add stronger RFQ hooks.

🏁 Baseline summary — what the redesign must beat

Measure the following on **Organic Search** (quality traffic), before → after cutover:

Metric	Legacy baseline	Redesign goal
Organic Search conversion (all key events)	4.23%	> 4.23%
Organic engagement rate	55.3%	≥ 55%
RFQ conversion (<code>Normal_RFQ</code> → <code>generate_lead</code>)	~0.04% blended / higher on organic	≥ baseline, like-for-like by source
Homepage landing conversion	12.59%	≥ 12.59%
Search miss rate (<code>*_Non_Exist</code> ÷ all searches)	~50%	lower (fewer dead-end searches)

Where the redesign can win biggest

1. **Get more of the top-of-funnel to engage** — only ~0.6% search or start a form today.
2. **Lift the `/nsn/*` SEO catalog pages** (1–2% today) with stronger RFQ hooks — that's where the organic volume lands.
3. **Cut the ~50% search-miss rate** — every missed part search is a lost RFQ.
4. **Protect the winners** — `/straightrfq` (62%) and homepage (12.6%).
5. **Desktop-first** — 99% of usage; don't over-invest in mobile.

Method notes & caveats

- Window: 2026-05-12 → 2026-08-09 (176,347 sessions) — ample volume, no need to widen.
- **Bot/low-quality traffic** dominates (Direct + Unassigned ≈ 97%); consider a GA4 bot/quality segment or compare Organic-only so it can't mask the redesign's effect.
- **Comparison integrity:** legacy `Normal_RFQ` vs redesign `generate_lead` may cover different RFQ paths — at launch, break `generate_lead` down by source and compare like-for-like.
- Launch model: **cutover in place** — add a GA4 **annotation** on the cutover date to mark the before/after boundary.
